Reflection

I've learned how to make a fullstack website and how to connect it to render mongodb and to have website that accept users input and show the list of it and delete the list they put. The challenges is about user.js and server js. And also about the mongodb I have so many challenges here about the node server. About the mongodb username I thought that the account I use in github was the one I will put in the terminal I kept repeating the steps here because the account or username in the mongodb was the one I shoyld put. Ive resolve it by replaying the demo because sometimes I mislook and didn't follow the step that is so suppose to do. Repeating the steps again so that I can totally follow the steps that I have to do and making sure that I did all and I didn't mislook some part of the demo so I wont be stuck on that phase. My improvement in this week was about making the render and mongodb and being careful on what I put on.
